                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                       This invention describes novel human and murine poly(ADP-ribose)

polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD^+-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_ZC (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which as the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.
                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                       240

polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2MHX_2C (I). The nucleic acid sequences motif, of general formula CX_2CX_2MHX_2C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP3 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, mentological (e.g. parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

                                                                                                                                                                                                                                                                           4;
                                                            polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^++binding site and no zinc finger sequence with a functional NAD^++binding site and no zinc finger sequences. PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.

This invention describes novel human and murine poly(ADP-ribose)

polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD<sup>+</sup>-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_ZC (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
clisease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              242

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, merological (e.g parkinsonism, menhigitis-associated intracranial complications and ischemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

This protein causes the covalent addition of polymerase (PRANEZ).

This protein causes the covalent addition of polymerase (PRANEZ).

This protein targets. hPARP2 activity is induced in many instances of coxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, e.g. ischemic stroke, hemorrhagic shock, myocardial ischemia or infarction, transplantation, cerebral vasospasm; rheumatoid, osteo- or gouty transplantation, cerebral vasospasm; rheumatoid, osteo- or gouty arthritis, spondyllitis; Behcet's disease; sepsis, septic or endotoxic shock, gram negative or positive sepsis, toxic shock syndrome; multiple organ injury syndrome secondary to septicemia, trauma, or hemorrhage; or allergic or vernal conjunctivitis, useltis, thyroid-associated ophthalmopathy; eosinophilic granuloma; asthma, chronic bronchitis, allergic or hinitis, ARDS, chronic obstructive pulmonary disease, allergic or hinitis, pulmonary sarcoldosis, pleurisy, alveolitis, reperfusion injury of the myocardium, brain or extremities; cystic fibrosis; plumonary sarcoldistis, pleurisy, alveolitis, resonance or sutchamatory bowel disease, contact or attofic dermatitis, peneroalises, inflammatory bowel disease, ulcerative colitis, inflammatory bowel disease, ulcerative colitis, neorotizing enterpoolitis; inflammatory dermatory contact or atopic dermatitis, posicians, and brain and spinal cord injury due to minor trainma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           injury due to minor trauma; Sjogren's syndrome; diseases involving leukocyte diapedesis; alcoholic hepatitis; bacterial pneumonia; antiportyte diapedesis; alcoholic hepatitis; bacterial pneumonia; antiport-antibody complex mediated diseases; hypovolemic shock; Type I diabetes mellitus; acute and delayed hypersensitivity; disease states due to leukocyte dyscrasia and metastasis; thermal injury; granulocyte transfusion associated syndromes; and cytokine-induced toxicity. hPARP2 and antibodies to it, can also be used to diagnose these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents human poly(ADP-ribose) polymerase (hPARP2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human poly(ADP-ribose) polymerase for treating inflammatory

```
AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antiporiatic; antiporklisonian; nootropic; neuroprotective;
costeopathic; anticonvulsant; antiarthritic; immunosuppressant;
costeopathic; anticonvulsant; antiarthritic; immunosuppressive;
antidiabetic; hypotensive; dermatological; immunosuppressive;

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-Those) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, menhigitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

                                                                                                                                                                                                                                        The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyporproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   466

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel human and murine poly(ADP-ribose) polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD<sup>+</sup>+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2NHX_2C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying pARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or isohemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP2 protein used in the method of the invention.

cardiant, vasotropic anticonvulsant, checking in an encorporate control of a cardiant, vasotropic, anticonvulsant, cytostatic, antibacterial, immunosuppressive, antinfonvulsant, cytostatic, antibacterial, immunosuppressive, antinfonvulsant, cytostatic, antibacterial, antidabetic. (I) are especially used for treating or preventing or preventing control decembers. (I) are especially used for treating or preventing neurodegenerative disease or neuronal damage (specifically apoplexy or parkinson's disease), treating or preventing ischemic damage for specifically renal damage after renal ischemia or during and after kidney transplantation or heart damage after cardiac ischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. petit mal and tonic-clonic attacks) or partial epileptic attacks (e.g. temporal lope and complex partial attacks), treating microinfarction (e.g. during and after heart valve replacement, aneuryam resectioning and heart transplantation), revascularization of critically constricted coronary arteries (e.g. leg arteries), treating accountable the term of the procession of the myocardial ischemia and damage during the interties (e.g. leg arteries), treating and treating and treating the procession of the myocardial ischemia and damage during the construction of the moral arteries (e.g. leg arteries), treating and treating and treating the procession of the myocardial ischemia and damage during the construction of the moral and the myocardial ischemia and damage during the metable of the myocardial ischemia and damage during the moral and the myocardial ischemia and damage during the moral and the myocardial ischemia and damage during the moral and the myocardial ischemia and damage during the moral and the myocardial ischemia and damage during the moral and the myocardial and damage during the moral and the myocardial damage during the moral and the myocardial and damage during the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     their metastasis, sepsis and septic shock, inflammatory and rheumatic disease (e.g. rheumatoid arthritis), and diabetes mellitus, although (I) inhibit pARP (i.e. the known form designated PARPI), they especially selectively and strongly inhibit PARP homologs, specifically the homolog ARPR2. In particular (I) have very strong PARP2 inhibitory activity (e.g. with K.i values of 1-20 nM) and high selectivity for PARP2 relative to PARPI (generally by a factor of more than 5).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         466

protein or nuclectide sequence; expression systems and host cells comprising an sbhPaRS2 nucleic acid sequence; the recombinant expression of sbhPaRS2 and an antibody specific for sbhPaRS2; sbhPaRS2 proteins of nuclectides are useful as vaccines for inducing an immunological response in a mammal. The sbhPaRS2 protein is useful for identifying compounds which inhibit or stimulate its activity or expression level. Such agonists and antagonists of sbhPaRS2 are useful for treating human diseases including ischaemia and ischaemic tissue injury (e.g., cerebral and cardiac ischaemia, myocardial infarction, stroke), inflammation, autoimmune disease (e.g., dabbetes, multiple sclerosis) and neurodegenerative disease (e.g., Parkinson's disease and Alzheimer's disease). sbhPaRS2 nucleic acids are useful as-diagnostic reagents for detecting mutations in the associated gene; as hybridisation probes to isolate full-length sbhPaRS2 cDNAs and sbhPaRS2 genomic clones; and for chromosome localisation studies. The sbhPaRS2 protein is also useful as a immunogen to produce antibodies for therapeutic use, sbhPaRS2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  proteins, nucleotides and antibodies are also useful in screening methods for detecting the effect of added compounds on the production of mRNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human polypeptide of the polyADPribose synthetase family for use in diagnostic assays and for screening modulators used for preventing and treating inflammation, autoimmune disease and Alzheimers disease
                                                                                                                                                                                             drug screening;

The present sequence represents a NAP protein. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polymucleotide sequences can be used for modulation of programmed cell death in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fung or nematedes; are male or female sterile, or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence. The complementary to the oligonucleotide which comprises a 1'-end sequence, and an oligonucleotide comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers are also useful for the chetcin and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers also also as a passible to AAH13628 and AAH13613 to AAH13629 to AAH13629 to AAH13629 contents and an animo acid sequences; and AAH13629 to AAH13632 contents and also and animo acid sequences; and AAH13629 to AAH13632 contents and animo acid sequences; and an the exemplification and animo acid sequences; and an animo acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yamamoto J;

                                                                                                                                                                                                    similarity).
-!-CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor -
nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!-SUBCELLULAR LOCATION: NUCLEAR (By similarity).
-!-ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.
-!-TISSUE SPECIFICITY: WIDELY EXPRESSED. THE HIGHEST LEVELS ARE IN TISSUE SPECIFICITY: PANCREAS, SKELETAL MUSCLE AND TESTIS: ALSO DETECTED IN KIDNEY, LIVER, LUNG, PLACERTA, OVARY AND SPLEEN.
LEVELS ARE LOW IN LEUKOCYTES, COLON, SMALL INTESTINE, PROSTATE AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             46 ESKKMPVÄGGKANKDRTEDKQDGMPGRSWASKRVSESVKÄLLLKGK-APVDPEC--TAKV 102

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor =
nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
COFACTOR: ZINC, CONTAINS TWO WOLES OF ZINC PER MOLE OF PROTEIN (BY
                                                                                                                          SIMILARITY).
SUBUNIT: HOMODIMER (Potential).
SUBCELLUALAR LOCATION: Nuclear.
MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUPO ON A HISTONE OR THE ENZYME ITSELE, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE RECULATION OF VARIOUS IMPORTANY CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE (BY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -i- CATALYTIC ACTIVITY: NAME (+) + {ADP-D-TIDOSY1]{N}-acceptor = nicotinamide + {ADP-D-TIDOSY1]{N+1}-acceptor.

-i- COFACTOR: ZING, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.

-i- SUBCELLULAR LOCATION: Nuclear.

-i- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.

-i- STAGE 12 EMBRYOS AND IN CELLS AROUND THE CENTRAL NERVOUS SYSTEM IN LATER EMBRYOS.

-i- DEVELOPMENTIAL STAGE: EXPRESSED BOTH MATERNALLY AND ZYGOTICALLY IN EMBRYOS.

-i- BEMBRYOS, PUPPAE AND ADULTS. EXPRESSION IS HIGHEST IN EMBRYOS.

-i- MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       POLY(ADP-RIBOSYL)ATION. This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation -

AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.
